Perforated Shelves Enhance Security in Your Warehouse

**Constructor has now launched perforated shelves to their shelving solution range.**

For pallet racking, a mesh grate shelving option was already available, but now we also offer a perforated shelving option.

These perforated shelves are mainly used in buildings when integrated with sprinkler systems, or where liquids/chemicals are primarily stored.

As the shelves are 60% permeable, this allows for liquids to easily pass through, which ensures that fires are easier to extinguish and spilt chemicals do not become a fire hazard.

The shelves are provided with an additional shelf support in the front, so that the perforated shelves can be mounted transversely on the shelf brackets, while guaranteeing the same load capacity.

The load capacity for shelves of 900mm and 1,000mm is 80 kg. Per level (based on a uniform distributed load).

The load capacity for shelves of 1,290 mm is 120 kg. per level (based on a uniform distributed load).
